

Tuesday, November 6 \*\* Transformations of  $\mathbb{R}^2$ .

**Purpose:** In class, we've seen several different coordinate systems on  $\mathbb{R}^2$  and  $\mathbb{R}^3$  beyond the usual rectangular ones: polar, cylindrical, and spherical. The lectures on Friday and Monday will cover the crucial technique of simplifying hard integrals using a change of coordinates (Section 15.9). The point of this worksheet is to familiarize you with some basic concepts and examples for this process.

**Starting point:** Here we consider a variety of transformations  $T: \mathbb{R}^2 \rightarrow \mathbb{R}^2$ . Previously, we have used such functions to describe vector fields on the plane, but we can also use them to describe ways of distorting the plane:

1. Consider the transformation  $T(x, y) = (x - 2y, x + 2y)$ .

- (a) Compute the image under  $T$  of each vertex in the below grid and make a careful plot of them, which should be fairly large as you will add to it later.

To speed this up, divide the task up among all members of the group.

- (b) For each pair  $A$  and  $B$  of vertices of the grid joined by a line, add the line segment joining  $T(A)$  to  $T(B)$  to your plot. This gives a rough picture of what  $T$  is doing.

Check your answer with the instructor.

- (c) What is the image of the  $x$ -axis under  $T$ ? The  $y$ -axis?
- (d) Consider the line  $L$  given by  $x + y = 1$ . What is the image of  $L$  under  $T$ ? Is it a circle, an ellipse, a hyperbole, or something else?
- Hint: First, parameterize  $L$  by  $\mathbf{r}: \mathbb{R} \rightarrow \mathbb{R}^2$  and then consider  $\mathbf{f}(t) = T(\mathbf{r}(t))$ .
- (e) Consider the circle  $C$  given by  $x^2 + y^2 = 1$ . What is the image of  $C$  under  $T$ ?
- (f) Add  $T(L)$ ,  $T(C)$  and  $T(\text{☺})$  to your picture. Check your answer with the instructor.

**Note:** The transformation  $T$  is a particularly simple sort called a *linear transformation*.

2. Consider the transformation  $T(x, y) = (y, x(1 + y^2))$ . Draw the image of the picture below under  $T$ .

Hint: Parameterize each of the 5 line segments and proceed as in 1(d). To speed things, divide up the task.

Check your answer with the instructor.

3. In this problem, you'll construct a transformation  $T: \mathbb{R}^2 \rightarrow \mathbb{R}^2$  which rotates counter-clockwise about the origin by  $\pi/4$ , as shown below.

- (a) Give a formula for  $T$  in terms of polar coordinates. That is, how does rotation affect  $r$  and  $\theta$ ?
- (b) Write down  $T$  in terms of the usual rectangular  $(x, y)$  coordinates. Hint: first convert into polar, apply part (a) and then convert back into rectangular coordinates.

Check your answer with the instructor.
