- Show sufficient work
- 1. (3 points each) Let  $\mathbf{R}$  be the region bounded by the x-axis and the graph of  $y=e^{-3x}$  on the interval [1, 5]. Set up, but do not evaluate, definite integrals which represent the given quantities. Use proper notation.
  - (a) The volume of the solid obtained when **R** is revolved around the line y = 4.

(b) The volume of the solid with base  $\mathbf{R}$  for which the cross-sections perpendicular to the x-axis are squares.

2.	(2 points)	Precisely state the Mean Value Theorem.
3.	(2 points)	Explain carefully why $f(x) = x^7 + 4x^3 + 23x - 200$ cannot have two real roots.
